COVER LETTER

Hello, Valentin here.

I just finished a 9-weeks full time Data Science bootcamp at Le Wagon and I have spent the past three years in the National Technological University of Argentina training as a Software Engineering with the university degree of Technical Programmer.

In my role as Software Engineering I proved to be efficient, enthusiastic and very organized. Now I'm immersed in Data Science and the characteristics that I have as a Software Engineering have been transferred to this field that I'm very passionate about. I have the necessary knowledge acquired in the three years of university training to create robust code, added to the great practical knowledge linked to Data Science acquired in the 400 hours provided by Le Wagon's intensive bootcamp.

My focus, serenity and commitment are what make me stand out to obtain a good technical performance in such an analytical and complex area as data science development. These compliments were reflected in two of the most important projects that I led during my studies in these three years.

The most recent one, Floods prediction in Santiago Metropolitan region, Chile, required a great team organization and task distribution. Since I approached the leadership of the team in this way and was able to discuss and draw inferences with my team, we were quickly able to find the right way to start, and subsequently move forward with the project. For this reason, we were able to meet all the deadlines set and obtain very accurate metrics in the forecast model developed. More information about technologies and skills used in my resume.

Thank you very much for your time and consideration. I have attached my resume with my application. Please feel free to contact me at fernandezradovich@gmail.com or via LinkedIn. I hope to hear from you soon.
